## beam trigger: BHD & T0

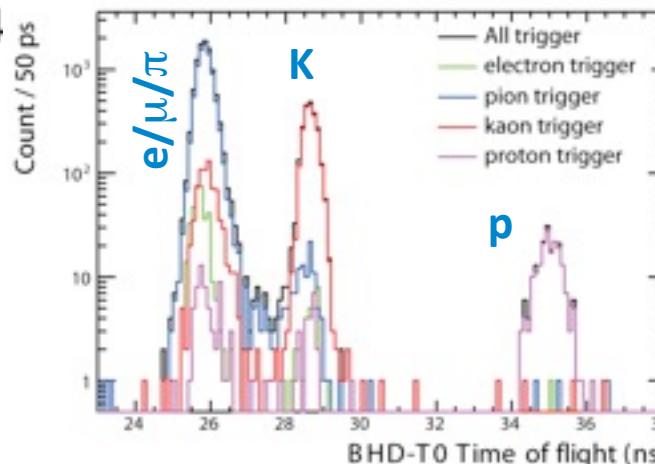

- ✓ plastic scintillator arrays
- ✓ TOF length (BHD-T0) = 7.7m
- ✓  $\sigma(\text{TOF}_{\text{BHD-T0}}) = 160\text{ps}$

## kaon identification at trigger level: AC

- ✓ mirror reflection type aerogel Cherenkov counter (index = 1.05)
- ✓  $\pi$  detection eff. = 96% (th=5p.e.)

## beam momentum: D5 & PDC & BLC

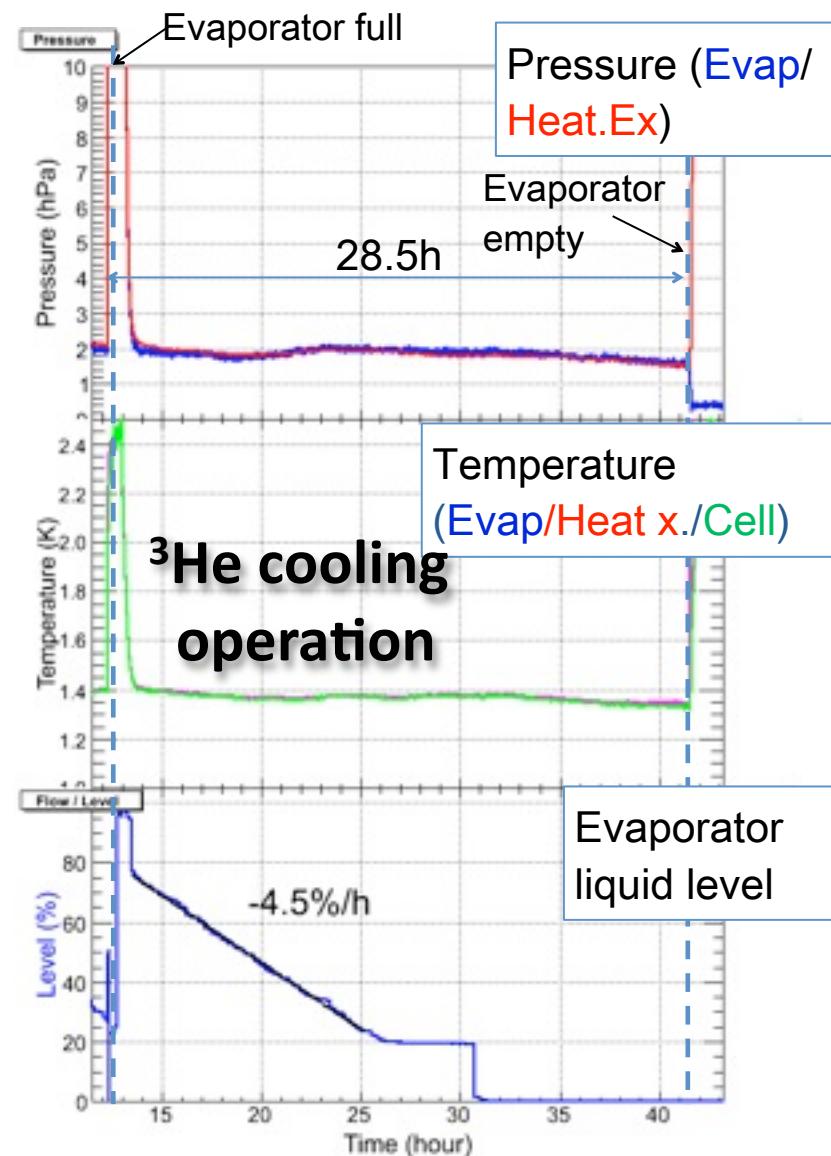

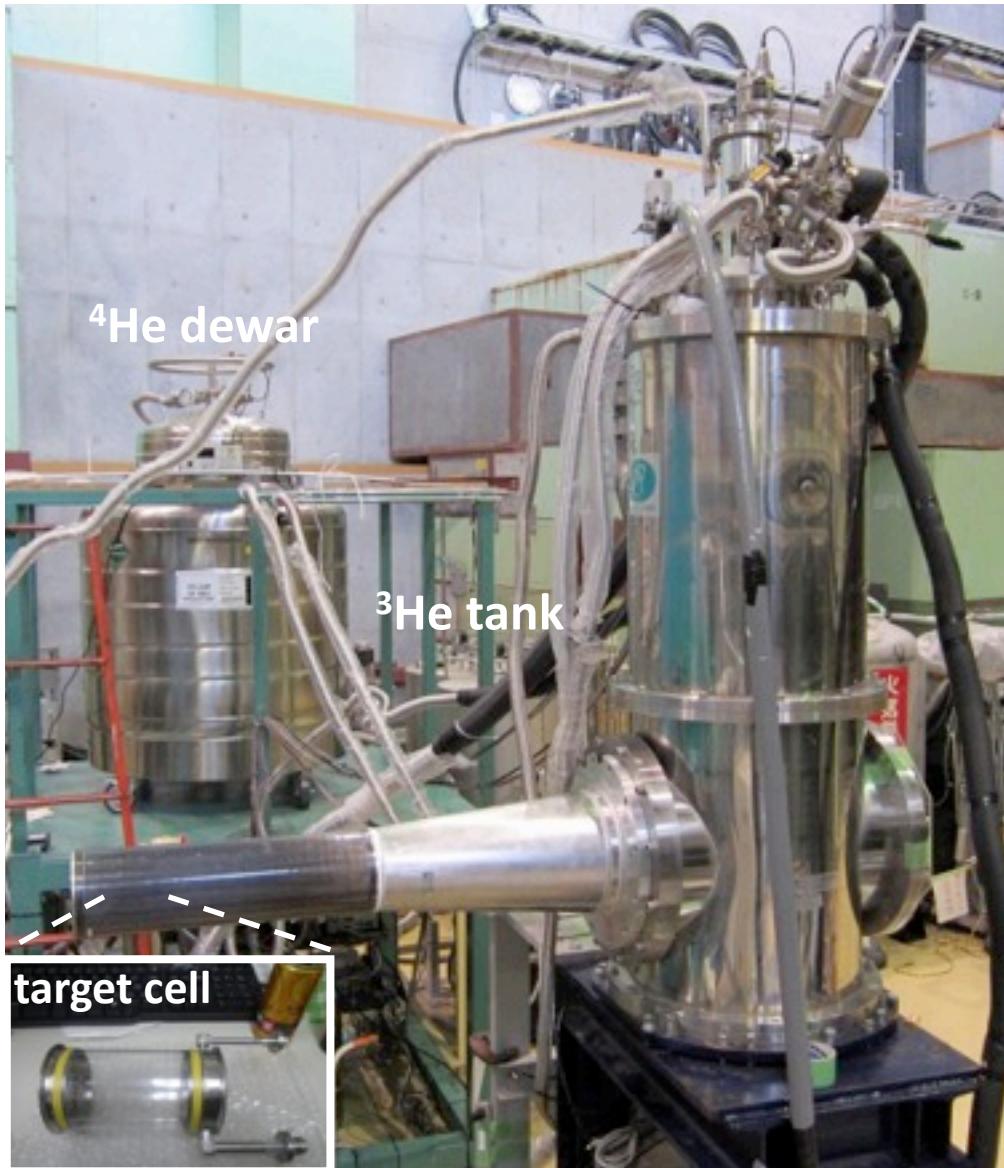

- ✓ dipole and wire drift chambers
- ✓ expected momentum resolution = 0.1%

## **TOF(BHD-T0)**

- Run#40
- +1.0 GeV/c
- ESS1 = +/-250kV

**proposed and approved = 270kW\*4weeks (@Ni-target)**

*Not easy to realize*

**Staging strategy**

**E15<sup>1st</sup> ~ 30kW\*week before long shutdown in 2013**

1. to know the background processes
2. to evaluate the realistic beam time for E15<sup>full</sup>
3. to present an information of the K<sup>bar</sup>N interaction  
→  ${}^3\text{He}(K^-, n)$  spectrum below K<sup>bar</sup>N threshold
4. to hunt for a hint of signal in  $\Lambda + p + n$  final states

**realize E15<sup>1st</sup> as soon as possible**
